

DOUGLASS KING SEED CO.

MAXIMO Forage Blend

Maximo is a combination of large seeded cereal grains and legumes selected on the basis of adaptation, ease of planting, establishment and early forage production to attract deer. The additions of highly palatable, soil improving legumes enhances the value of the plot for both the deer and the land. Maximo is an excellent forage source from Fall thru Winter, and can withstand periods of low temperatures.

Suggested planting rate is 30-70 lbs per acre at a depth of 1" - 2".

The blend consists of:

Oats	Winter Wheat
Triticale	Alamo Tetraploid Ryegrass
Annual Ryegrass	Austrian Winter Peas
Hairy Vetch	

Cool season forages are for planting during the fall through the winter to provide for wildlife during the temperate time of the year. Our cool season seed mixes are a great attractant during deer season and give the deer a nutritional jump start for the spring.
